SeqPlotter: Python package for sequence data analysis and visualization

SeqPlotter is a Python package developed to streamline the visualization and analysis of biological sequence data. It provides seamlessly integration into your Python workflow, with robust data handling capabilities, intuitive visualization, and useful analysis features. From parsing raw sequence files to creating stunning plots and charts.

1. Working with DNA sequences

1.1. Importing DNA module

```
In [1]: # Importing module
        from seqplotter.nucl import DNA
```

1.2. Creating DNA objects

```
>>> dna_seq1 = DNA("seqID", "DNA_sequence")
```

Output: retruns a DNA object with seqid and seq pair

```
In [2]: # creating DNA object with seqID and sequence pair
        seq1 = DNA("seq1", "GTGTTTTGACTAATAATTGGTCAAGCCTAC")
```

1.3. Sequence length

```
>>> dna_seq1.length()
```

Output: returns sequence length (int) in bp

```
In [3]: # print sequence length
        seq1.length()
```

```
Out[3]: 30
```

1.4. Sequence composition

```
>>> dna_seq1.comp()
```

Output: returns a dict object with sequence composition i.e. count of each nucleotides

```
In [4]: # print sequence composition
        seq1.comp()
```
```
Out[4]: {'A': 26.666666666666668,
         'T': 36.666666666666664,
         'G': 20.0,
         'C': 16.666666666666664}
```

1.5 Sequence composition barplot

```
>>> seq1_comp = dna_seq1.comp()
>>> DNA.barplot(seq1_comp)
```

Output: generate barplot showing sequence composition

```
In [5]: # plot sequence composition
        comp = seq1.comp()
        DNA.barplot(comp)
```

1.6. Sequence slicing

```
>>> # returns nucleotide for the given position
>>> dna_seq1.slice(pos)

>>> # returns nucleotides between start to end position
>>> dna_seq1.slice(start_pos, end_pos)
```

Output: returns a string that contain the sliced sequence

In [6]:
```python
# slice particular position
seq1.slice(2)
```

Out[6]: 'T'

In [7]:
```python
# slice with start and end index
seq1.slice(2,5)
```

Out[7]: 'TGTT'

1.7. GC content

```
>>> dna_seq1.gc_percent()
```

Output: returns GC percent (string)

In [8]:
```python
# GC percent
seq1.gc_percent()
```
Out[8]: '36.67'

1.8. K-mer abundance plot

```
# generated k-mer plot with default kmer size (k=3)
>>> dna_seq1..kmer_abundance_plot()

# generate k-mer plot with k=6
>>> dna_seq1..kmer_abundance_plot(6)
```

Output: generate k-mer plot (histogram)

In [9]:
```python
# kmer abundance plot
seq1.kmer_abundance_plot()
```

1.9. Translate gene sequence

```
>>> dna_seq1.translate()
```

Output: translate DNA sequence into amino acid sequence

```
In [10… # translate sequence
        seq1.translate()
```

```
Out[10… 'VF*LIIGQAY'
```

1.10. Readling FASTA file (DNA Sequence)

```
>>> fasta_records = DNA.read_fasta("/path/to/fasta/file")
```

Output: returns a list containing DNA object(s)

```
In [11… # reading a FASTA file
        data = DNA.read_fasta("seq.fasta")
```

1.11. Using head() and tail() functions

```
>>> # return summary of first 5 sequence (default)
>>> DNA.head()

>>> # return summary of first 10 sequence
>>> DNA.head(10)

>>> # return summary of last 5 sequence (default)
>>> DNA.tail()

>>> # return summary of last 10 sequence
>>> DNA.tail(10)
```

Output: print head and tail summary of parsed FASTA file

```
In [12… # print first five records (by default)
        DNA.head()
```

```
seqID   seq
seq1:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACA]
seq2:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACA]
seq3:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACA]
seq4:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGAAACTATGTTCCATTACCAGTACA]
seq5:   [TCACAGAAGAGCAAGAGGCTCTTGTAGTGAAGTCTTGGAGTGTCATGAAGAAAAACTCAGCTGAATTAGG]
```

```
In [13… # print first two records
        DNA.head(2)
```

```
seqID   seq
seq1:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACA]
seq2:   [CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACA]
```

```
In [14…   # print last five records (by default)
          DNA.tail()
```

```
seqID    seq
seq5:    [TCACAGAAGAGCAAGAGGCTCTTGTAGTGAAGTCTTGGAGTGTCATGAAGAAAAACTCAGCTGAATTAGG]
seq6:    [TCTCAAACTCTTCATCAAGTAAGTAATGATCCCATTGATCTCTCTCTATTTTCTTTTTATGTATATAGCA]
seq7:    [TGAGATATGAACTACTATTTTGAACTGTAGGATCTTTGAGATTGCACCAACAACGA]
seq8:    [TTCTTGAGAGACTCACCAATTCCTGCTGAGCAAAATCCAAAGCTCAAGCCTCACGCAATGTCTGT]
seq9:    [TCATGGTAATAATCAATATCAAATAACATGATTTT]
```

```
In [15…   # print last six records
          DNA.tail(3)
```

```
seqID    seq
seq7:    [TGAGATATGAACTACTATTTTGAACTGTAGGATCTTTGAGATTGCACCAACAACGA]
seq8:    [TTCTTGAGAGACTCACCAATTCCTGCTGAGCAAAATCCAAAGCTCAAGCCTCACGCAATGTCTGT]
seq9:    [TCATGGTAATAATCAATATCAAATAACATGATTTT]
```

1.12. Count records

```
>>> DNA.count(fasta_records)
```

Output: returns sequence count (int) i.e. number of records

```
In [16…   # print record counts
          DNA.count(data)
```

```
Out[16…   9
```

1.13. Find record

```
>>> DNA.where(seqid="seq1")
```

Output: returns sequence for a given sequenceID

```
In [17…   # find sequence
          DNA.where(seqid="seq1")
```
```
Out[17…   'CTTTTCTTTAGTGTTTTGACTAATAATTGGTCAAGCCTACCATTACAAACTATGTTCCATTACCAGTACACTTTTCTTTAGTGTTTTGACTAATAATTGGATTACCA
          GTACA'
```

1.14. GC percent per sequence plot

```
>>> DNA.gc_plot(fasta_records)
```

Output: generate barplot showing per sequence GC percent

```
In [18…   # GC barplot
          DNA.gc_plot(data)
```

1.15. Boxplot showing GC distribution

```
>>> DNA.gc_distribution_plot(fasta_records)
```

Output: generate boxplot showing overall GC distribution across all the sequences

In [19… `# GC distribution plot`
`DNA.gc_distribution_plot(data)`

1.16. Boxplot showing nucleotides distribution

```
>>> DNA.nt_distribution_plot(fasta_records)
```

Output: generate boxplot showing overall nucleotides distribution across all the sequences

In [20… `# Nucleotides distribution plot`
`DNA.nt_distribution_plot(data)`

1.17. Stacked barplot showing per sequence base composition

```
>>> DNA.per_sequence_comp(fasta_records)
```

Output: generate stacked barplot showing per sequence nucleotide composition

In [21… `# Per sequence nucleotides composition`
`DNA.per_sequence_comp(data)`

1.18. Barplot showing per sequence length

```
>>> DNA.length_plot(fasta_records)
```

Output: generate barplot showing per sequence length distribution

```
In [22… # Per sequence length
        DNA.length_plot(data)
```

1.19. Boxplot showing overall length distribution

```
>>> DNA.length_distribution_plot(fasta_records)
```

Output: generate boxplot showing overall length distribution across all the sequences

```
In [23… # Boxplot showing length distribution
        DNA.length_distribution_plot(data)
```
1.20. Overall k-mer abundance pattern

```
# default k-mer size (k=3)
>>> DNA.combined_kmer_abundance_plot(fasta_records)

# kmer size (k=7)
>>> DNA.combined_kmer_abundance_plot(fasta_records, 7)
```

Output: generate combined k-mer abundance plot (histogram) for all the sequence

```
In [24… # Combined kmers distribution
        DNA.combined_kmer_abundance_plot(data)
```

1.21. Converting sequence object to feature matrix

```
>>> from seqplotter_analysis import seq2feature
>>> feature_matrix = seq2feature(fasta_records) # with default options (k=3, min_sample=1)

>>> feature_matrix = seq2feature(fasta_records, 6, 2) # with (k=6, min_sample=2)
```

Options:

- k: kmer size
- min_sample: threshold of considering a k-mer as feature

Output: returns a dict object containing following keys ("matrix", "sample", "kmers"), where "kmers" are columns and "sample" are rows

‹ *dict{"matrix": numpy_array, "sample": seqID_list, "kmers": kmers_list}* ›

```
In [25…   # Importing module
          from seqplotter_analysis import seq2feature

          # Converting sequence to feature matrix
          feature_matrix = seq2feature(data)

          # Visualizing feature matrix
          import pandas as pd
          pd.DataFrame(feature_matrix["matrix"], index=feature_matrix["sample"], columns=feature_matrix["kmers"])
```

Out[25…

9 rows × 54 columns

1.22. Principal component analysis

```
>>> from seqplotter_analysis import PCA
>>> pca_matrix = PCA(feature_matrix) # return pca matrix with first 2 PCs

>>> pca_matrix = PCA(feature_matrix, 3) # return pca matrix with first 3 PCs
```

Output: returns a dict object containing following keys ("matrix", "sample", "components"), where "components" are columns and "sample" are rows

⟨ dict{"matrix": numpy_array, "sample": seqID_list, "components": PCA_components} ⟩

```
In [26…   # Importing module
          from seqplotter_analysis import PCA

          # Performing PCA
          pca_matrix = PCA(feature_matrix)

          # Visualizing PCA matrix
          import pandas as pd
          pd.DataFrame(pca_matrix["matrix"], index=pca_matrix["sample"], columns=pca_matrix["components"])
```

Out[26…

	PC-1	PC-2
seq1	9.629055	2.243708
seq2	5.947428	3.774627
seq3	6.225862	4.230590

seq8	-7.607692	0.437185
seq9	-4.673917	0.906603

1.23. Plot scatter plot using PCs

```
>>> from seqplotter_analysis import plot_pca

# Sequence IDs will be treated as class label (default)
>>> plot_pca(pca_matrix)
```
```
# Providing class labels as list
>>> labels = [3, 3, 3, 2, 1, 4, 1, 1, 1]
>>> plot_pca(pca_matrix, labels)
```

Output: generate PCA plot (2D scatter plot using first two components i.e. PC-1 and PC-2)

In [27…
```
# Importing module
from seqplotter_analysis import plot_pca

# Plotting 2D PCA plot
labels = [3, 3, 3, 2, 1, 4, 1, 1, 1]
plot_pca(pca_matrix, labels)
```

1.24. Create sequence logo

```
>>> from seqplotter_analysis import seq_logo

# Reading motif sequences file
>>> logo_data = DNA.read_fasta("motif_seq.fasta")

# Generate sequence logo
>>> seq_logo(logo_data, seq_type)
```
Output: generate DNA sequence logo using motif sequences

In [28…
```
# Importing module
from seqplotter_analysis import seq_logo

# Reading motif sequences file
data = DNA.read_fasta("dna_motif_seq.fasta")

# Generate sequence logo
seq_logo(data, "DNA")
```

1.25 Generate random nucleotide sequence

```
# Generating random sequences with given length and GC content
>>> DNA.generate_random_seq(lenght, GC_frequency, count)
```

Output: append random sequences object of given length and GC content to the DNA object

```
In [29…  # Clearing records
         DNA.clear()

         # Generating 10 random sequences with 70 bp length and 30% GC content
         new_data = DNA.generate_random_seq(70, 0.3, 10)

         # Printing first 5 random sequences
         DNA.head()
```

```
seqID    seq
random_seq1:    [TCTATTACACTGAATAAATTTAAACCCGTGGTGTATTATATTTTACCTCTTTAAATGAATTTCACTATAA]
random_seq2:    [CAATGTACGATAATGCTCTTTATAATTAGCGTTGAGATTTCTCCTTTTTATCTATCATTCGCTAAATACT]
random_seq3:    [ACATGTTTATCAGTTTGTCCTATTGATGTTATCATTATTATTGATGATATTACCAAGGGCAATTGCAAAT]
random_seq4:    [GTAAATCATTTACTCTCAACAGAATAAATTGTAATAATCTGTATGATAGAATACATGTTAATCGTTGATA]
random_seq5:    [ATTAGTGATACAAACAGATTCATACTAATTAAAAGTTAACCTGTTCATTATTGAACTAAGTAATTCAATG]
```

2. Working with Protein sequences

2.1. Importing PROT module

```
In [30…  # Importing module
         from seqplotter.prot import PROT
```

2.2 Creating PROT object

```
>>> prot_seq1 = PROT("seqID", "protein_sequence")
```

Output: retruns a DNA object with seqid and seq pair

```
In [31…  # Creating Protein object with seqID and sequence pair
         seq1 = PROT("seq1", "VDEVGGEALGRLLVVYPWTQRFFESFGDLSTPDAV")
```

2.3. Sequence length

```
>>> prot_seq1.length()
```

Output: returns sequence length (int) in bp

```
In [32…  # print sequence length
         seq1.length()
```

```
Out[32…  35
```

2.4. Sequence composition

```
>>> prot_seq1.comp()
```

Output: returns a dict object with sequence composition i.e. count of each amino acids

```
In [33…  # print sequence composition
         seq1.comp()
```

```
Out[33…  {'A': 5.714285714285714,
          'R': 5.166051660516605,
          'N': 0.0,
          'D': 7.163266076755573,
          'C': 0.0,
          'Q': 2.1718543403148107,
          'E': 6.353851345091472,
          'G': 7.909936022986237,
          'H': 0.0,
          'I': 0.0,
          'L': 7.342245635482005,
          'K': 0.0,
          'M': 0.0,
          'F': 5.188382310331203,
          'P': 3.3327849177003355,
          'S': 3.260373880823663,
          'T': 3.1947334484658114,
          'W': 1.567453020447904,
          'Y': 1.5536341292308162,
          'V': 7.701922950367426}
```
2.5. Sequence composition plot

```
>>> prot_comp = prot_seq1.comp()
>>> PROT.barplot(prot_comp)
```

Output: generate barplot showing sequence composition

In [34… # plot sequence composition
         comp = seq1.comp()
         PROT.barplot(comp)

2.6. Molecular weight in KDa

```
>>> prot_seq1.mol_weight()
```

Output: return molecular weight (int) of a protein sequence in KDa

In [35… # molecular weight
         seq1.mol_weight()

Out[35… 3.87

2.7. Sequence slicing

```
>>> # returns amino acid for the given position
>>> prot_seq1.slice(pos)

>>> # returns amino acids between start to end position
>>> prot_seq1.slice(start_pos, end_pos)
```

Output: returns a string that contain the sliced sequence

In [36… # slice particular position
         seq1.slice(6)

Out[36… 'G'

In [37… # slice with start and end index
         seq1.slice(4,8)

Out[37… 'VGGEA'

2.8. Reading FASTA file (Protein sequence)

```
>>> fasta_records = PROT.read_fasta("/path/to/fasta/file")
```

Output: returns a list containing PROT object(s)

In [38… # reading a FASTA file
         data = PROT.read_fasta("prot_seq.fasta")

2.9. Using head() and tail() functions
```

```
>>> # return summary of first 5 sequence (default)
>>> PROT.head()

>>> # return summary of first 10 sequence
>>> PROT.head(10)

>>> # return summary of last 5 sequence (default)
>>> PROT.tail()

>>> # return summary of last 10 sequence
>>> PROT.tail(10)
```

Output: print head and tail summary of parsed FASTA file

In [39…
```python
# Head
PROT.head(5)
```

```
seqID    seq
seq1:    [MVHLTPEEKSAVTALWGKVNVDEVGGEALGRLLVVYPWTQRFFESFGDLSTPDAVMGNPKVKAHGKKVLG]
seq2:    [MLPFWKRLLYAAVIAGALVGADAQFWKTAGTAGSIQDSVKHYNRNEPKFPIDDSYDIVDSAGVARGDLPP]
seq3:    [TGQKGDRGEPGLNGLPGNPGQKGEPGRAGATGKPGLLGPPGPPGGGRGTPGPPGPKGPRGYVGAPGPQGL]
seq4:    [LPGATGEPGKPALCDLSLIEPLKGDKGYPGAPGAKGVQGFKGAEGLPGIPGPKGEFGFKGEKGLSGAPGN]
```

In [40…
```python
# Tail
PROT.tail()
```

```
seqID    seq
seq1:    [MVHLTPEEKSAVTALWGKVNVDEVGGEALGRLLVVYPWTQRFFESFGDLSTPDAVMGNPKVKAHGKKVLG]
seq2:    [MLPFWKRLLYAAVIAGALVGADAQFWKTAGTAGSIQDSVKHYNRNEPKFPIDDSYDIVDSAGVARGDLPP]
seq3:    [TGQKGDRGEPGLNGLPGNPGQKGEPGRAGATGKPGLLGPPGPPGGGRGTPGPPGPKGPRGYVGAPGPQGL]
seq4:    [LPGATGEPGKPALCDLSLIEPLKGDKGYPGAPGAKGVQGFKGAEGLPGIPGPKGEFGFKGEKGLSGAPGN]
```

2.10. Count records

```
>>> PROT.count(fasta_records)
```

Output: returns sequence count (int) i.e. number of records

In [41…
```python
# Sequence count
PROT.count(data)
```

Out[41…
```
4
```

2.11. Find record

```
>>> PROT.where(seqid="seq2")
```

Output: returns sequence for the given sequenceID

In [42…
```python
# Find sequence
PROT.where(seqid="seq2")
```

Out[42…
```
'MLPFWKRLLYAAVIAGALVGADAQFWKTAGTAGSIQDSVKHYNRNEPKFPIDDSYDIVDSAGVARGDLPPKNCTAGYAGCVPKCIAEKGNRGLPGPLGPTGLKGEMG
FPGMEGPSGDKGQKGDPGPYGQRGDKGERGSPGLHGQAGVPGVQGPAGNPGAPGINGKDGCDGQDGIPGLEGLSGMPGPRGYAGQLGSKGEKGEPAKENGDYA'
```

2.12. Amino acids distribution plot

```
>>> PROT.aa_distribution_plot(fasta_records)
```

Output: generate boxplot showing overall amino acids distribution across all the sequences

In [43…
```python
# Boxplot aa distribution plot
PROT.aa_distribution_plot(data)
```
2.13. Stacked barplot showing per sequence amino acid composition

```
>>> PROT.per_sequence_comp(fasta_records)
```

Output: generate stacked barplot showing per sequence amino acids composition

In [44…
```python
# Per sequence nucleotides composition
PROT.per_sequence_comp(data)
```

2.14. Barplot showing per sequence length

```
PROT.length_plot(fasta_records)
```

Output: generate barplot showing per sequence length distribution

In [45…
```python
# Per sequence length
PROT.length_plot(data)
```

2.15. Boxplot showing overall length distribution

```
>>> PROT.length_distribution_plot(fasta_records)
```

Output: generate boxplot showing overall length distribution across all the sequences

In [46… `PROT.length_distribution_plot(data)`

2.16. Converting sequence object to feature matrix

```
>>> from seqplotter_analysis import seq2feature
>>> feature_matrix = seq2feature(fasta_records) # with default options (k=3, min_sample=1)

>>> feature_matrix = seq2feature(fasta_records, 6, 2) # with (k=6, min_sample=2)
```

Options:

- k: kmer size
- min_sample: threshold of considering a k-mer as feature

Output: returns a dict object containing following keys ("matrix", "sample", "kmers"), where "kmers" are columns and "sample" are rows

‹ *dict{"matrix": numpy_array, "sample": seqID_list, "kmers": kmers_list}* ›

In [47…
```python
# Importing module
from seqplotter_analysis import seq2feature

# Converting sequence to feature matrix
feature_matrix = seq2feature(data)
```

```
# Visualizing feature matrix
import pandas as pd
pd.DataFrame(feature_matrix["matrix"], index=feature_matrix["sample"], columns=feature_matrix["kmers"])
```

Out[47…

	RLL	GDL	DLS	GNP	GKK	DGL	LKG	KGT	FWK	AGA	...	DAG	PGY	GYP	YPG	GAK	AKG	GFK	FKG	GRD	RDG

2.17 Principal component analysis

```
>>> from seqplotter_analysis import PCA
>>> pca_matrix = PCA(feature_matrix) # return pca matrix with first 2 PCs

>>> pca_matrix = PCA(feature_matrix, 3) # return pca matrix with first 3 PCs
```

Output: returns a dict object containing following keys ("matrix", "sample", "components"), where "components" are columns and "sample" are rows

⟨ *dict{"matrix": numpy_array, "sample": seqID_list, "components": PCA_components}* ⟩

In [48…
```
# Importing module
from seqplotter_analysis import PCA

# Performing PCA
pca_matrix = PCA(feature_matrix)

# Visualizing PCA matrix
import pandas as pd
pd.DataFrame(pca_matrix["matrix"], index=pca_matrix["sample"], columns=pca_matrix["components"])
```

Out[48…

	PC-1	PC-2
seq1	5.069106	-3.616282
seq2	2.496495	-2.811089
seq3	-11.398262	-0.046961
seq4	3.832661	6.474332

2.18. Plot scatter plot using PCs

```
>>> from seqplotter_analysis import plot_pca

# Sequence IDs will be treated as class label (default)
>>> plot_pca(pca_matrix)

# Providing class labels as list
>>> labels = [3, 3, 3, 2, 1, 4, 1, 1, 1]
>>> plot_pca(pca_matrix, labels)
```

Output: generate PCA plot (2D scatter plot using first two components i.e. PC-1 and PC-2)

In [49…
```
# Importing module
from seqplotter_analysis import plot_pca

# Plotting 2D PCA plot
labels = [1, 1, 2, 3]
plot_pca(pca_matrix, labels)
```

2.19. Create sequence logo

```
>>> from seqplotter_analysis import seq_logo

# Reading motif sequences file
>>> logo_data = PROT.read_fasta("motif_seq.fasta")

# Generate sequence logo
>>> seq_logo(logo_data, seq_type)
```

Output: generate protein sequence logo using motif sequences

```
In [50…    # Importing module
           from seqplotter_analysis import seq_logo

           # Reading motif sequences file
           data = PROT.read_fasta("prot_motif_seq.fasta")

           # Generate sequence logo
           seq_logo(data, "PROT")
```

2.20. Generate hydrophobicity plot

```
>>> from seqplotter_analysis import hydrophobicity_plot

# Amino acid sequence for seq2 seqID
>>> seq = PROT.where(seqid="seq2")

# Create hydrophobicity plot
>>> hydrophobicity_plot(seq, window_size)
```

Output: generate hydrophobicity plot for a given protein sequence

```
In [51…    from seqplotter_analysis import hydrophobicity_plot

           # Amino acid sequence for seq2 seqID
           seq = PROT.where(seqid="seq2")
```

```
# Create hydrophobicity plot
hydrophobicity_plot(seq, 9)
```
